How Verification Makes Training Better

By b2cdatabases 1

Furthermore, verified sets often include "bounding boxes." These are squares drawn around the objects in the image. These boxes tell the computer exactly where the object is located. This is very helpful for tasks like self-driving cars. The car needs to know exactly where the pedestrian is standing. Because the data is verified, the car can trust the information. Consequently, the car stays safe on the road. This level of detail is only found in professional, verified datasets. It is what separ...
